COP2334C Module 7 Programming Assignment 1

- You will need a GitHub account for this assignment. You can create a free account at github.com. Once you have created your account, you will be able to accept the GitHub classroom invitation.
- When you accept this invitation a private GitHub repository will be created. NOTE: I must be able to determine your name from your GitHub profile name in order to give you credit for the assignment.
- From here you will need to download the .cpp starter file found in this repository (if you are familiar with the Git command line tool you can clone it).
- After downloading the file, complete the following tasks:
    - A 4-line identification header **at the top of the file** in the following form (replace the contents of these lines with your information)

        ```
        // filename.cpp – provide a meaningful name for your file
        // your name
        // date of your submission
        // one line description of what the program does – do not exceed 80 columns
        ```

    - Find the "Add your code here" in the source file and complete the required code to produce the expected output. Your statement(s) must not exceed 80 columns in length, included correct indentation. If necessary, break your statements up at an operator.
    - Compile and execute the code and take a screenshot of the output (do not screenshot the source code!)

        Expected output:

        ```
        0 deg C is 32 deg F
        10 deg C is 50 deg F
        20 deg C is 68 deg F
        30 deg C is 86 deg F
        40 deg C is 104 deg F
        ```

- Submit your code solution and your screenshot to the repository (again, if you are familiar with the Git command line tool you can push your code up to the remote repository). Do not submit .o or .exe files, only submit your .cpp file and screenshot as a .png or .jpg file.

This assignment is worth 20 points;

- up to 10 points for code that compiles and executes as required.
- up to 5 points for the 4-line ID header
- up to 5 points for your screenshot showing successful execution

There is no Canvas submission for this assignment; you must submit to the GitHub repository. This code has been tested on the Horizon Windows 11 system (AcademicIT_W11 at horizon.fscj.edu), you can use that system to complete this assignment if you do not have the required software on a personal system.
